J. Garvin

Slide 1/10

## Similar Triangles

In the diagram below,  $\triangle ABC \sim \triangle ADE$  since  $\angle A$  is common to both triangles, and  $\angle ACB = \angle AED$ .

This means that any ratio of two sides in  $\triangle ABC$  is equal to the ratio of corresponding sides in  $\triangle ADE$ .

Slide 2/10

## Similar Triangles

By varying the measure of  $\angle A$ , the ratio of two sides in  $\triangle ABC$  will change, but will remain equal to the ratio of corresponding sides in  $\triangle ADE$ .

Therefore, a specific measure of  $\angle A$  can be associated with a specific ratio of two sides in a right triangle.

Is the ratio of two sides associated with a given angle unique?

Consider the ratio of the opposite side to the hypotenuse.

If  $\angle A$  increases, the length of the opposite side also increases. Thus, the ratio will increase.

If  $\angle A$  decreases, the length of the opposite side also decreases. Thus, the ratio will decrease.

In both scenarios, the ratio changes with the measure of  $\angle A$ . Therefore, the ratio associated with a specific angle is unique.

## Primary Trigonometric Ratios

In the right triangle  $\triangle ABC$  below, the three sides have been labelled based on their position relative to  $\angle A$ .

The opposite and adjacent sides are reversed relative to  $\angle B$ , but the hypotenuse is *always* across from the right angle.

Slide 4/10

## Primary Trigonometric Ratios

There are six possible ratios of sides that can be made from the three sides.

The three *primary trigonometric ratios* are *sine*, *cosine* and *tangent*.

### Primary Trigonometric Ratios

Let  $\triangle ABC$  be a right triangle with  $\angle A \neq 90^\circ$ . Then, the three primary trigonometric ratios for  $\angle A$  are:

$$\text{Sine: } \sin A = \frac{\text{opposite}}{\text{hypotenuse}}$$

$$\text{Cosine: } \cos A = \frac{\text{adjacent}}{\text{hypotenuse}}$$

$$\text{Tangent: } \tan A = \frac{\text{opposite}}{\text{adjacent}}$$

The phrase *SOH-CAH-TOA* is a mnemonic for these ratios.

## Primary Trigonometric Ratios

### Example

State the three primary trigonometric ratios for  $\angle A$  in  $\triangle ABC$ .

$$\sin A = \frac{\text{opp}}{\text{hyp}} = \frac{3}{5}$$

$$\cos A = \frac{\text{adj}}{\text{hyp}} = \frac{4}{5}$$

$$\tan A = \frac{\text{opp}}{\text{adj}} = \frac{3}{4}$$

## Primary Trigonometric Ratios

### Example

State the three primary trigonometric ratios for  $\angle A$  in  $\triangle ABC$ . Express all ratios in simplest form.

$$\begin{aligned}\sin A &= \frac{\text{opp}}{\text{hyp}} \\ &= \frac{10}{26} \\ &= \frac{5}{13} \\ \cos A &= \frac{\text{adj}}{\text{hyp}} \\ &= \frac{24}{26} \\ &= \frac{12}{13} \\ \tan A &= \frac{\text{opp}}{\text{adj}} \\ &= \frac{10}{24} \\ &= \frac{5}{12}\end{aligned}$$

## Primary Trigonometric Ratios

### Example

State the three primary trigonometric ratios for  $\angle A$  in  $\triangle ABC$ .

Use the Pythagorean Theorem to determine the length of the hypotenuse,  $h$ .

$$\begin{aligned}h^2 &= 6^2 + 3^2 \\ h^2 &= 45 \\ h &= \sqrt{45}\end{aligned}$$

## Primary Trigonometric Ratios

This gives us the following right triangle.

$$\begin{aligned}\sin A &= \frac{\text{opp}}{\text{hyp}} \\ &= \frac{3}{\sqrt{45}} \\ \cos A &= \frac{\text{adj}}{\text{hyp}} \\ &= \frac{6}{\sqrt{45}} \\ \tan A &= \frac{\text{opp}}{\text{adj}} \\ &= \frac{3}{6} \\ &= \frac{1}{2}\end{aligned}$$
